

Introducing EYE-View™

Transmit VIDEO information across the Internet in REAL TIME!

"Extend Your Expertise"

EYE-View™ is a real-time, *mobile* wireless video system that is capable of transmitting any analog video signal (like a camcorder, thermal imager, VCR, etc.) across the Internet, either through the cellular or WiFi network. EYE-View™ allows an expertise to be applied remotely using video and the Internet. An EYE-View™ operator provides real-time video to a client-viewer, an in-house "expert" or an important decision maker who is in a remote location. The client-viewer directs the operator to show the video images using the mobile camera unit. The images are then sent to the image management unit, and transmitted to the Internet. Using only Internet Explorer web browser and a broadband connection, the client-viewer can view the video in real time. By using a cell phone, the client-viewer can provide the operator direct feedback and direction to see what he wants to see in real time. EYE-View™ is easy to set up and use and it provides a level of capability and application of expertise unmatched in the industry.

Features of EYE-View™

- Real-time video sessions over the Internet with direct feedback between client-viewer and camera operator using existing wireless infrastructure including cellular or WiFi.
- Full digital recording capability for archiving and viewing Video-in/Video-out for recording and uploading video sessions for multiple viewings on web site.
- Video-In/Video-out for interfacing other video and monitor sources to be viewed locally or remotely for training purposes.
- Client-viewer can capture still images from video session and save them to their local computer.

Featured Applications

• Remote Diagnostics	• Scientific Collaboration
• Law Enforcement	• Security & Surveillance
• Real Estate	• Retail/Auctions

In all cases, video is being transmitted across the Internet in real time to provide information to an expert, who would not have the information otherwise, without being on location.

Equipment included with EYE-View™ Platinum Series

The EYE-View™ comes complete with a wireless image management unit and a mobile camera unit. The image management unit is a compact receiver unit with all the

necessary hardware to access the Internet through either a WiFi link or a cellular connection. Once through the image management unit, the video images then become accessible on a secure web site for viewing by one or more client at a time. The mobile camera unit is provided with a Sony camcorder and an Internet mobile transmitter unit. All necessary cables and connectors are included. Other video cameras can be interfaced with the system and are available.
